**EXAMINER'S AMENDMENT**

***Priority***

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.
2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Stephen Olson on 19 March 2008.

The application has been amended as follows:

Claim 1. (Currently Amended) Interface of a tool having a first part comprising a seat configured as a female taper, which part has a first conduit section located concentrically with its center axis, a second part having a hollow shaft taper introduceable into the female taper mount, which part has a second conduit section located concentrically with its center axis and a hole with a wall which is provided with an annular groove surrounding a clamping shoulder, where the center axes of the first and second parts align, and having a collet chuck anchored in the first part having two chuck jaws which comprises an actuating device coacting with the chuck jaws which

can be activated by means of an actuating element, where the chuck jaws engage the annular groove from inside in one operating position, wherein characterized in that the collet chuck has a full-length central passage which continues firstly into the first conduit section in the first part and secondly into the second conduit section in the second part and in that the actuating device has a caging element which can be shifted to two operating positions and which has a central passage which is located such that the center axes of the first and second parts run through said passage in both operating positions, wherein the actuating device is accessible through a first radial recess in the hollow shaft taper and through a second radial recess provided in the first part and aligning with the first recess.

Claim 2. (Canceled)

Claim 6. (Currently Amended) Interface in accordance with claim 1 2, wherein a cap nut is provided which is furnished with an internal thread coacting with the second lug and an external thread coacting with the second chuck jaw.

Claim 8. (Currently Amended) Interface in accordance with claim 6 4, wherein the internal thread and the external thread on the cap nut have the same pitch.

Claim 9. (Currently Amended) Interface in accordance with claim 1, further comprising characterized by a small tube which projects at least through areas of the conduit

section in the first part, of the passage in the caging element and at least partially through areas of the second conduit section in the second part.

***Allowable Subject Matter***

3. Claims 1 and 3-9 are allowed. Claim 1 is the independent claim.
4. The following is an examiner's statement of reasons for allowance:

The closest prior art of record is U.S. Patent 5,860,776 to Sato et al. Sato et al. discloses an interface of a tool having a first part 1 comprising a seat 1b configured as a female taper, which part has a first conduit section 1a located concentrically with its center axis, a second part T having a hollow shaft taper (not labeled, mates with 1a, see figure 1) introduceable into the mount, which part has a second conduit section Ta located concentrically with its center axis and a hole (for accepting collet 12) with a wall which is provided with an annular groove (not labeled, see figure 1) surrounding a clamping shoulder Tb, where the center axes of the first and second parts align, and having a collet chuck 12 anchored in the first part having two chuck jaws 12a which comprises an actuating device 2b coacting with the chuck jaws which can be activated by means of an actuating element 2, where the chuck jaws engage the annular groove from inside in one operating position, characterized in that the collet chuck has a full-length central passage (not labeled, see figure 1) which continues firstly into the first conduit section in the first part and secondly into the second conduit section in the second part and in that the actuating device 2b has a caging element 2d which can be shifted to two operating positions (left and right) and which has a central passage (not

labeled, see figure 1) which is located such that the center axes of the first and second parts run through said passage in both operating positions.

The patent to Sato et al. does not disclose "wherein the actuating device is accessible through a first radial recess in the hollow shaft taper and through a second radial recess provided in the first part and aligning with the first recess" as claimed in independent claim 1, and as such does not anticipate the instant invention as disclosed in independent claim 1.

Furthermore, there is no combinable teaching in the prior art of record that would reasonably motivate one having ordinary skill in the art to so modify the teachings of Sato et al., and thus, for at least the foregoing reasoning, the prior art of record does not render obvious the present invention as set forth in independent claim 1.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Conclusion***

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
